

Design Specification

Process diagram

Tooling specification

The solution requires a combination of tools to enable and support objectives in scope. These have been chosen to follow principles of ease of use, integration, scalability and cost.

Capability	Tool/Technology	Reasoning	Trade-offs
Source data	Find Case Law API	Source used by the Case Law team, solution is strictly focused on data processing	Dependent on the availability of the API. Changes to the API structure will require workflow updates
Workflow automation	n8n	Enables rapid deployment of MVP solution, with extensive integration capabilities across a range of APIs	Less flexible than a bespoke application, limited by platform capabilities
AI/LLM	OpenAI (ChatGPT-5-mini)	Used in previous workflows, little cost per token	Results may not be up to highest standards, costs may affect long-term suitability
Data storage	AWS Relational Database Service	Aligns with team skillset, scalable solution and integrates well with other tools	Introduces cloud infrastructure costs and requires database configuration and maintenance
Human review interface	Tableau	Enables rapid dashboard development, easy to be maintained by non-technical staff	Not built for interaction, requires additional implementation and validation
Text input	Slack	Used in Case Desk team's current process	Not straightforward to implement input validation
Project management	Jira	Suited for task tracking and delegation across team members	Can become overly complex for a project of this scope if not managed properly

Documentation	Google Workspace	Ease of use for collaboration and document tracking	Requires careful organisation and communication to keep documentation in sync
Drafting and planning	Excalidraw	Ease of use for diagramming and collaboration	Intended strictly for rough planning, should not become a single source of truth

Risks

Risks must be considered and planned for with regards to the AI agent used as part of the solution. As an organisation dealing with legal information, the stakeholder has an obligation to provide accurate and neutral information to its partners. The AI agent must have guardrails in place to ensure its outputs are able to be trusted by staff, and to ensure its outputs remain consistently reliable.

Risk	Risk level	Description	Reasoning	Required control
Legal advice	High	The AI agent may provide legal advice or present its outputs as authoritative legal guidance	JusticeLensUK's role is strictly to educate and make the law more accessible, and does not possess any soliciting authority	Clear AI prompt guardrails; human review
Mistranslation or distortion of legal meaning	High	Simplifying complex legal language could alter their meaning or misrepresent reasoning in the judgment	JusticeLensUK serves a variety of non-legal audiences, making the accuracy of their work a critical aspect	AI self-confidence assessment; a link to the original judgment document at human review
Bias in summarisation	High	The AI agent may unintentionally introduce subjective language concerning parties or officials involved	JusticeLensUK serves diverse audiences including educators, so must communicate legal information impartially	Definition of requirements for neutral language in summarisations; human review
Hallucination	High	The AI agent may introduce facts, reasoning or conclusions that may	Unsupported information in a briefing could mislead audiences and	AI self-confidence assessment; a link to the original judgment document at human

		not appear	damage the integrity of JusticeLensUK's work	review
Loss of legal nuance	Medium	The generated briefing may remove legally significant distinctions or context	Plain-language summarisation inherently reduces complexity, creating a risk that important legal nuance is lost	Define mandatory information to include in a briefing with a structured template
Lack of traceability	High	The AI agent may produce an incorrect decision with no traceable line of reasoning	The current process already suffers from a lack of visibility, so this solution must address it to be effective	Record every decision, reasoning and timestamp in an audit log
False positives	Low	Cases not relevant to the specified topic areas may be selected	This results in additional human effort to review cases, undermining the purpose of the solution	AI self-confidence assessment regarding its relevance assignment on a judgment
